

Virginia Trout Stream Sensitivity Study 2010 Survey Sites

445 native brook trout streams located in 34 western Virginia counties will be sampled during the last week of April and the first week of May.

Stream water samples will be analyzed as part of an ongoing investigation of acidic deposition effects on native brook trout streams in Virginia. Analysis will be performed by the Department of Environmental Sciences at the University of Virginia. Trout Unlimited will organize the sample collection. Previous surveys were conducted in 1987 and 2000.
